

ADVANCED SOLUTIONS
Upgrade kits

Long life to your machine

Continuous innovation and modular concept are Karlville Swiss' trademarks: their combination makes it possible to easily implement new features and solutions on your machines throughout their lifecycle.

Discover how to always keep up with innovation thanks to our portfolio of upgrade.

U01

Single & double cut high speed guillotine

An upgrade to the guillotine is essential for the production of paper-based pouches, which includes the addition of servo-motorization for automatic adjustment in machine direction.

This enhancement is particularly beneficial for digitally printed materials and stretchy structures, especially when there are inconsistencies in print repetition, thereby reducing the need for manual adjustments by operators.

Furthermore, the double cut implementation significantly increases production speed compared to earlier solutions

Boost your double cutting efficiency

U02

Camera vision system

The enhancement of the camera vision system is beneficial for aligning the punching position with the printing and cross-cutting positions.

This upgrade is especially advantageous in the production of rounded corner pouches with a single cut, thereby improving operational speed.

Additionally, it contributes to material waste reduction by eliminating the need for a double cut function.

Optimize material usage thanks to accurate alignment

U03

Longitudinal station automatic adjustment

Implement a longitudinal station automatic adjustment system (servo-driven) in the machine direction to align with the printing reference.

This enhancement is particularly beneficial for maintaining the alignment of the bottom sealing with the printed material.

It is especially advantageous for digitally printed webs, mono-materials, or situations where the print repeat is inconsistent, thereby reducing the need for manual adjustments by the operator.

Make your operator's life easier
